- 1 air connection
- 2 grip (handle)
- 3 impact mechanism
- 4 clamping collar (sleeve)
- 5 mounting mandrel
- 6 seat
- 7 tool

**Technical data:**

air consume 300 L/min

air pressure 7-8 bar

weight depending on the tool 2-6 kg

SPL 91,5 – 93,5 – 99,5 decibel

depending on the tool

acceleration 15 m/s<sup>2</sup>

**Starting up of Turbo-Digger:**

- 1.) Fit together the air connection (1) with the air hose of the compressor. Lock the snap ring of the mody-coupling.
- 2.) Fit together the tool (7) and seat (6): Retract the clamping collar (4), insert the mounting mandrel (5) of the tool (7), loose the clamping collar (4) to fix the tool (7).
- 3.) Touch down the grip to start the impact mechanism (3).
- 4.) Loose the grip (2) to stop the impact mechanism (3)

**Don't start the impact mechanism without resistance of the tool !!**

**Don't drive in the tool up to the mounting mandrel !!**

**Controll about ducts and pipes before drive in the tool !!**

**Controll the tool about right mounting. Do not make strikes (empty) without resistance.**

- 5.) Change the tool while retract the clamping collar (4) and remove the tool (7).

**Servicing:** Before operating, fill in a little ecologically desivable creep oil into the air connection (4).

**Support:** The Turbo-Digger has to be supported with the impact mechanism down.

**Attention:** Use a hearing protection !  
Use safety shoes !  
Not to use against energie source !  
Not to use against human or animals !

## Operating-method

### Turbo Digger TD / BS / BTS / TDL

**Use only uninjured and tested high pressure hoses (min. 20 bar) and tested Safety connecting parts.**

**Use only tested air compressors.**

### Removing of all movable surfaces like plaster, ceramic, carpet, lime floor, bitumen mortar, bitumen, bitumen felt, bark, green, etc.:

Place the tool of the TD on the material you wish to remove.

Start the striking mechanism while pushing the grip 2.

Press the tool continuously forward against the removing material.

### Digging of holes in soil:

Place the tool of the TD on the surface.

Start the striking mechanism while pushing the grip 2.

Drive in (press) the spade or shovel into the ground.

Remove the insert spade out of soil, while you are pressing the spade shortly in front of yourself or sideways, therefore you are reducing the affinity of the tool.

### Cutting of roots – digging of plant bales:

Take only sharp tools (insert spade, plant bale spade).

Place the tool on the surface of the soil.

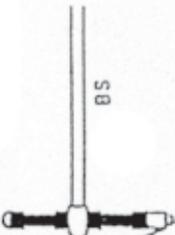

Start the impact mechanism while pushing the grip 2.

Press continuously the insert spade or plant bale spade without moving forward or behind up to the time you feel the roots are cut.

Then move the tool shortly in front of yourself or sideways, so you are losing the affinity of the soil.

There is no more warranty and liability if you don't use the original parts and tools
